EX.NO:10 Schedule Requirements in Zoho Creator (Daily, Weekly, Monthly)

ROLL NO :240701573

NAME: UMAR FAROOK K

AIM:

To create a schedule in Zoho Creator for the SmartCare - Clinic Management System application that automatically sends a medical record follow-up reminder email, and to understand how schedules can be set to run daily, weekly or monthly.

THEORY:

A **schedule** in Zoho Creator is a workflow that runs automatically at a set date and time, without any user opening a form or clicking a button. It is used for work that must happen on a timetable, such as reminders, status updates, report emails and clean-up of old records. A schedule is created under Workflow → Schedules and has two parts: **when** it runs, and the **actions** it performs, such as sending a mail, sending a notification or updating records through a Deluge script. Actions can run without a condition or only when a condition is met.

A schedule can run on the date held in a record (a record-date schedule, as used in this experiment) or repeat at a fixed frequency. The common frequencies are:

Frequency	When it runs	Typical use
Daily	Every day at the chosen time	Daily appointment reminders
Weekly	On the chosen day(s) of every week	Weekly summary report to the manager
Monthly	On the chosen date of every month	Monthly billing or invoice reminders

A schedule can be switched on or off using its status toggle, so it can be paused without being deleted. In this experiment a schedule named **Scheduled Medical Record Notification** is attached to the **Medical Records** form and sends a follow-up reminder mail to the administrator.

PROCEDURE:

1. Sign in to Zoho Creator, open the SmartCare - Clinic Management System application and click the Workflow tab.
2. Open the Schedules tab and click New Workflow.
3. Enter the name Scheduled Medical Record Notification, select the form Medical Records, and choose the schedule based on the record date. To repeat a schedule, set the frequency to Daily, Weekly or Monthly and fill in the start date, day or date, and time.
4. In the workflow builder, under Execute without condition, click Add New Action and choose Send Mail.
5. In the Send email window set From and To as zoho.adminuserid and enter the subject Medical Record Follow-up Reminder.
6. Type the message asking the doctor to review the medical record, diagnosis, treatment plan and prescription, keep the content type as HTML, and click Update.
7. Click Done and check that the schedule is listed with 1 Action, the trigger Record Date and the status Enabled.
8. When the schedule runs, open the mailbox and verify that the email “Medical Record Follow-up Reminder” has been received from the Zoho Creator notification address.

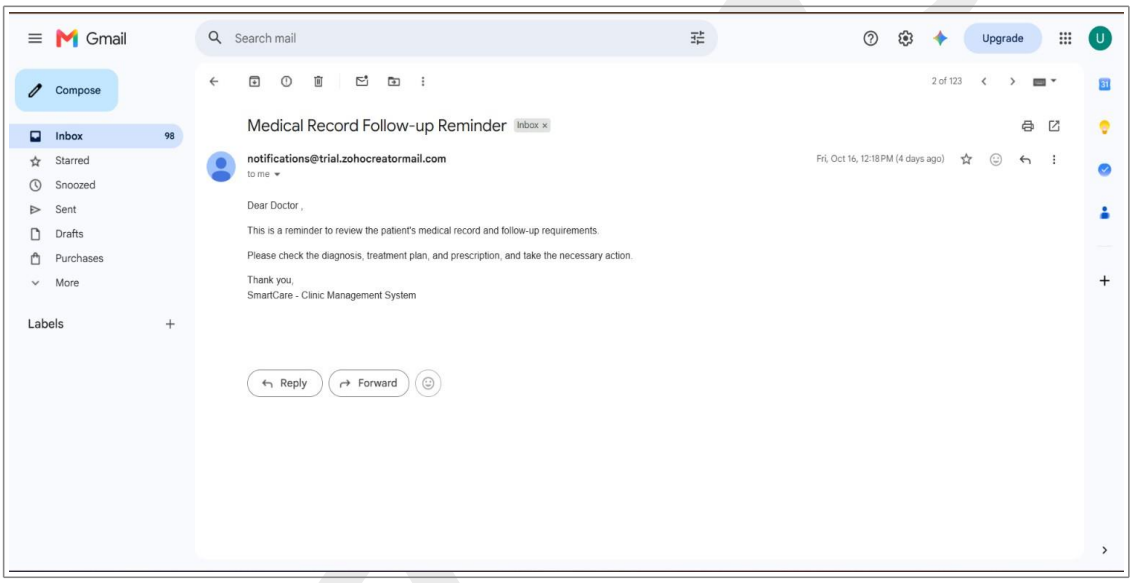

Fig. 5: Reminder email received in the mailbox

RESULT:

Thus, the schedule Scheduled Medical Record Notification was successfully created and enabled in the SmartCare - Clinic Management System in Zoho Creator. The schedule ran its Send Mail action and the Medical Record Follow-up Reminder email was received, which verified the working of the schedule and how daily, weekly and monthly schedules are set up.
